Project description

'A trip to the new museum for the Civil Aviation University of China will be a trip where one can experience the journey of FLIGHT/AVIATION, a celebration of how an ancient dream was developed to our present day reality'.

The design solution was developed in accordance to the hierarchy of functions within the building, with the museum as the main focus, supported by ancillary educational and research facilities. The order of spaces maps a storey of aviation through time and is represented through the exhibits in the exhibition halls and the areas dedicated to learning. The circulation route allows the user to progress throughout the museum from beginning to end, hinged along its length with physical nodal points that are multi functional.
